Lab 14: RNAseq Mini Project2

AUTHOR
Tiffany Chin 15700705

Import Data

We need two things "Counts" and "MetaData" (what DESeq calls colData - as it describes the columns in Counts)

```
counts <- read.csv("GSE37704_featurecounts.csv", row.names=1)
head(counts)
```

```
                length SRR493366 SRR493367 SRR493368 SRR493369 SRR493370
ENSG00000186092    918         0         0         0         0         0
ENSG00000279928    718         0         0         0         0         0
ENSG00000279457   1982        23        28        29        29        28
ENSG00000278566    939         0         0         0         0         0
ENSG00000273547    939         0         0         0         0         0
ENSG00000187634   3214       124       123       205       207       212
                SRR493371
ENSG00000186092         0
ENSG00000279928         0
ENSG00000279457        46
ENSG00000278566         0
ENSG00000273547         0
ENSG00000187634       258
```

```
metadata <- read.csv("GSE37704_metadata.csv")
head(metadata)
```

```
         id     condition
1 SRR493366 control_sirna
2 SRR493367 control_sirna
3 SRR493368 control_sirna
4 SRR493369      hoxa1_kd
5 SRR493370      hoxa1_kd
6 SRR493371      hoxa1_kd
```

Data Cleanup

We want the columns in `counts` to match the rows in the `metadata`

```
colnames(counts)
```

```
[1] "length"    "SRR493366" "SRR493367" "SRR493368" "SRR493369" "SRR493370"
[7] "SRR493371"
```

```
metadata$id
```

```
[1] "SRR493366" "SRR493367" "SRR493368" "SRR493369" "SRR493370" "SRR493371"
```

We can get rid of the first column in `counts` to make these match

```
countData <- counts[,-1]
head(countData)
```

```
                SRR493366 SRR493367 SRR493368 SRR493369 SRR493370 SRR493371
ENSG00000186092         0         0         0         0         0         0
ENSG00000279928         0         0         0         0         0         0
ENSG00000279457        23        28        29        29        28        46
ENSG00000278566         0         0         0         0         0         0
ENSG00000273547         0         0         0         0         0         0
ENSG00000187634       124       123       205       207       212       258
```

```
colnames(countData) == metadata$id
```

```
[1] TRUE TRUE TRUE TRUE TRUE TRUE
```

```
#to check if all conditions are true
all(colnames(countData) == metadata$id)
```

```
[1] TRUE
```

Filter out zero counts

It is standard practice to remove any genes/transcripts that we have no data for- i.e. zero counts in all columns.

```
#keep genes with more than 0 counts across the conditions summed
#just removing genes with 0 in all samples
to.keep.inds <- rowSums(countData) > 0
cleanCounts <- countData[to.keep.inds,]
head(cleanCounts)
```

```
                SRR493366 SRR493367 SRR493368 SRR493369 SRR493370 SRR493371
ENSG00000279457        23        28        29        29        28        46
ENSG00000187634       124       123       205       207       212       258
ENSG00000188976      1637      1831      2383      1226      1326      1504

```

Annotation of genes

First, I need to "translate" our ENSEMBL IDs in `res` object to Entrez and gene symbol formats.

For this, I will use the AnnotationDbi package and its `mapIds()` function.

```
library(AnnotationDbi)
library(org.Hs.eg.db)
```

```
columns(org.Hs.eg.db)
```

```
 [1] "ACCNUM"       "ALIAS"        "ENSEMBL"      "ENSEMBLPROT"  "ENSEMBLTRANS"
 [6] "ENTREZID"     "ENZYME"       "EVIDENCE"     "EVIDENCEALL"  "GENENAME"
[11] "GENETYPE"     "GO"           "GOALL"        "IPI"          "MAP"
[16] "OMIM"         "ONTOLOGY"     "ONTOLOGYALL"  "PATH"         "PFAM"
[21] "PMID"         "PROSITE"      "REFSEQ"       "SYMBOL"       "UCSCKG"
[26] "UNIPROT"
```

We already have "ENSEMBL". Let's map to "SYMBOL", "ENTREZID", "GENENAME" using "ENSEMBL"

```
res$genename <- mapIds(org.Hs.eg.db,
       keys = rownames(res),
       keytype= "ENSEMBL",
       column = "GENENAME")
```

```
'select()' returned 1:many mapping between keys and columns
```

```
res$entrez <- mapIds(org.Hs.eg.db,
       keys = rownames(res),
       keytype= "ENSEMBL",
       column = "ENTREZID")
```

```
'select()' returned 1:many mapping between keys and columns
```

```
res$symbol <- mapIds(org.Hs.eg.db,
       keys = rownames(res),
       keytype= "ENSEMBL",
       column = "SYMBOL")
```

```
'select()' returned 1:many mapping between keys and columns
```

```
head(res)
```

```
log2 fold change (MLE): condition hoxa1 kd vs control sirna
Wald test p-value: condition hoxa1 kd vs control sirna

ENSG00000187583 9.19031e-01 pleckstrin homology ..       84069     PLEKHN1
ENSG00000187642 4.03379e-01 PPARGC1 and ESRR ind..       84808       PERM1
```

Before going any further, let's focus in on a subset of "top" hits

We can use a starting point log2FC of +2/-2 and adjusted P-value of 0.05.

```
#use absolute value to negate the sign. returns T/F for genes that have values for more t
#use & to combine both log2FC and padj filters
top.inds <- (abs(res$log2FoldChange)) > 2 & (res$padj < 0.05)
```

Why are there some values in our dataset that aren't T or F, but "NA"? These should be false, so we need to manually change them to false

```
top.inds[is.na(top.inds)] <- FALSE
```

Let's save our "top genes" to a CSV file

```
top.genes <- res[top.inds, ]
write.csv(top.genes, file = "top_geneset.csv")
```

Pathway Analysis

Now we can do some pathway analysis!

```
library(pathview)
```

```
################################################################################
Pathview is an open source software package distributed under GNU General
Public License version 3 (GPLv3). Details of GPLv3 is available at
http://www.gnu.org/licenses/gpl-3.0.html. Particullary, users are required to
formally cite the original Pathview paper (not just mention it) in publications
or products. For details, do citation("pathview") within R.

The pathview downloads and uses KEGG data. Non-academic uses may require a KEGG
license agreement (details at http://www.kegg.jp/kegg/legal.html).
################################################################################
```

```
library(gage)
```

```
library(gageData)

data(kegg.sets.hs)
data(sigmet.idx.hs)
```

```
kegg.sets.hs = kegg.sets.hs[sigmet.idx.hs]
```

The **gage** function wants a vector of importance as input with gene names as labels - KEGG speaks ENTREZ

```
foldchanges <- res$log2FoldChange
names(foldchanges) <- res$entrez
head(foldchanges)
```

```
      <NA>      148398       26155      339451       84069       84808 
0.17925708  0.42645712 -0.69272046  0.72975561  0.04057653  0.54281049 
```

Run gage with these values

```
keggres <- gage(foldchanges, gsets = kegg.sets.hs)
```

```
attributes(keggres)
```

```
$names
[1] "greater" "less"    "stats"
```

```
head(keggres$less)
```

```

Reactome Analysis

To run reactome online, we need to make a wee text file with one gene name per line.

```
sig_genes <- res[res$padj <= 0.05 & !is.na(res$padj), "symbol"]
print(paste("Total number of significant genes:", length(sig_genes)))
```

```
[1] "Total number of significant genes: 8147"
```

```
write.table(sig_genes, file="significant_genes.txt", row.names=FALSE, col.names=FALSE, qu
```
